Il sistema dei controlli interni.

READ AND TRANSLATE – ARGOMENTO DA 2 PUNTI

IL CANDIDATO LEGGA E TRADUCA IL TESTO ALLEGATO.

Three handwritten signatures are visible at the bottom left of the page. The first is a large, stylized black signature. The second is a smaller, more compact black signature. The third is a blue signature, possibly in ink or marker, located to the right of the black ones.

Your friends in numbers

HOW MANY FRIENDS does the average person have? A researcher at Cornell University in the USA has recently done a study into this question, by finding out the number of friends a typical American has. He has just published the results. The researcher interviewed more than 2,000 adults aged 18 and over in his study. He asked them to list the names of the people they had discussed serious matters with in the last six months. About 48% of the people taking part gave the researcher one name, 18% gave him two, and about 29% gave him more than two.

These results contrast dramatically with the news published by social networking site Facebook recently. They said that the average user on the site has 130 friends. The Cornell University study found the average number of friends to be a lot lower – 2.03 to be exact. The researcher from Cornell has explained that the difference lies in the definition of the word *friend*. A friend on Facebook may be a person that the user has met by chance or someone that they will never meet in real life. However, the friends in his study are close friends, who participants feel comfortable discussing their problems with.
